Microsoft Access is a complete relational database management system that offers powerful tools for creating tables, queries, forms and reports. This concise guide to building databases begins with a short but practical overview of good database design--beginning with how to model the numerous tables that are required to manage the real world facts about objects, places, or events. Following the design review, you learn how to: Create tables and establish field data types, validation rules, input masks, indices and primary keys, and formatting; Establish relational joins between tables to model one-to-one, one-to-many, and many-to-many relationships; Build queries to ask specific questions of your databases, or to perform common maintenance tasks against your tables and their data; Create forms and reports that make working with relational data easy. You'll be introduced to creating simple and complex forms that allow you to work with any kind of related data. Also covered is the topic of creating powerful grouped and summary reports. This title is the first in a series on Building components for a Microsoft Access database. The books in this series focus on a task-based approach to learning Microsoft Access and therefore differ from other books that feature a complete review of all the commands and tools available in Microsoft Access. Schiavone taught database design for large organizations for over 10 years. This task-based approach to learning is the result of years of field experience in training office and technology workers what they need to know to get the job done.--Publisher's description.
